Audit: Codex | Skill workflow: Alex Labat

Executive Summary

Invoiceo has a usable, clearly described invoice generator, but the deployed site is weakly prepared for organic discovery and answer extraction. Its public HTML is an empty JavaScript shell, the sitemap is invalid, and missing routes return successful HTTP statuses. The public content footprint is essentially one marketing page with limited trust information and no answer-focused guidance. Fix delivery and publish verified product/help information before pursuing advanced markup or AI-specific tactics. These scores describe observed readiness, not rankings, penalties or guaranteed outcomes.

Scores assess observed readiness, not rankings or penalties.

Dimension	Score	Status
SEO	3/10	Needs Work
GEO	2/10	Needs Work
AEO	2/10	Needs Work

Scope, Evidence and Limits

Full audit of every discovered public content URL, plus authentication metadata, infrastructure endpoints and likely information-page candidates. 14 URLs rendered in headless Chrome at 390×844; 16 primary www endpoints fetched as HTTP responses; apex HTTPS and www HTTP redirects checked. 18 total URL targets inspected (14 rendered, 4 file/variant-only). The homepage is the only live content-rich page discovered. No arbitrary page cap was used; no valid sitemap was available, so undiscovered orphan pages cannot be excluded. Public read-only testing only; no account login, invoice submission, deployment or source modification performed.

No Search Console, backlink platform, analytics, server/CDN logs, field Core Web Vitals, authenticated UX audit, real AI answer sampling, competitor study, or keyword-volume data. Scores are qualitative analyst judgments: SEO 3/10, GEO 2/10, AEO 2/10 (combined 7/30). SEO is held back by empty first-response content, invalid sitemap/soft 404s and minimal

metadata; GEO by low entity/trust clarity and crawlable factual coverage; AEO by absent questions/steps/definitions. Mobile observations cover one browser/viewport, not all devices. Search queries cannot establish complete index coverage. A failed web-reader request is not proof of an AI crawler block.

Pages Audited

URL	Type	Observation
https://www.invoiceo.site/	Marketing	Real page; 174 words; client rendered
https://www.invoiceo.site/about	Candidate route	Rendered 404; HTTP 200; shared title
https://www.invoiceo.site/help	Candidate route	Rendered 404; HTTP 200; shared title
https://www.invoiceo.site/privacy	Candidate route	Rendered 404; HTTP 200; shared title
https://www.invoiceo.site/terms	Candidate route	Rendered 404; HTTP 200; shared title
https://www.invoiceo.site/cookies	Candidate route	Rendered 404; HTTP 200; shared title
https://www.invoiceo.site/not-a-real-page-audit-20261005	Test error	Rendered 404; HTTP 200; shared title
https://www.invoiceo.site/login	Authentication	Real auth page; no noindex; shared title
https://www.invoiceo.site/signup	Authentication	Real auth page; no noindex; shared title
https://www.invoiceo.site/faq	Candidate route	Rendered 404; HTTP 200; shared title

URL	Type	Observation
https://www.invoiceo.site/contact	Candidate route	Rendered 404; HTTP 200; shared title
https://www.invoiceo.site/blog	Candidate route	Rendered 404; HTTP 200; shared title
https://www.invoiceo.site/pricing	Candidate route	Rendered 404; HTTP 200; shared title
https://www.invoiceo.site/sitemap.xml	Invalid sitemap	Rendered 404; HTTP 200; shared title
https://www.invoiceo.site/robots.txt	Crawler file	404 text/plain; no directives
https://www.invoiceo.site/lms.txt	Optional AI file	404; not required
https://invoiceo.site/	Host variant	301 to HTTPS www
http://www.invoiceo.site/	Protocol variant	301 to HTTPS www

SEO · Technical on-page

Signal	Finding and recommendation	Priority
Initial HTML	All tested HTML routes deliver the same 1,609-byte shell with an empty #root. No homepage copy or crawlable navigation is present before JavaScript. Google can render JavaScript; crawlers without rendering will receive no main content. Pre-render the public marketing pages, retaining the interactive invoice app. [S1]	High

Signal	Finding and recommendation	Priority
Title	Raw and rendered title is Invoiceo (8 characters) on all 14 rendered URLs, including error pages. The homepage title does not describe the invoice generator. Use distinct, accurate titles; character ranges are editorial guidance, not eligibility rules.	High
Description	No meta description in raw or rendered head. Write a clear homepage summary describing guest PDF creation; Google may use page content instead. There is no fixed Google character limit. [S4]	High
Canonical	No rel=canonical in raw or rendered pages. The apex-to-www redirect is good, but use self-referencing canonicals on real public pages; do not canonicalize every route to home.	Medium
Index directives	No robots meta and no X-Robots-Tag in captured HTML responses. Public home has no accidental noindex. Login/signup and rendered error routes also lack noindex. Keep private data authenticated; crawl blocking is not access control. [S5]	High

Signal	Finding and recommendation	Priority
HTTP status	Invented /not-a-real-page-audit-20261005 returns HTTP 200 and renders Page not found. Tested missing content routes behave similarly: genuine soft 404 behavior. Return 404/410 for unknown paths; avoid an indiscriminate SPA fallback. [S1,S2]	Critical
Sitemap	/sitemap.xml returns HTTP 200, text/html, the same app shell, and a rendered 404. It is not a sitemap. Publish valid XML containing only canonical, indexable, real public URLs.	Critical
Robots.txt	/robots.txt returns HTTP 404 text/plain. This is not a crawl ban: Google treats most 4xx responses as no crawl restrictions. Publish explicit policy and a valid sitemap pointer. [S3]	Medium
Protocol/host	https://invoiceo.site/ and http://www.invoiceo.site/ each return 301 to https://www.invoiceo.site/. HTTPS www is the established preferred homepage.	Good
Mobile foundation	Viewport meta and lang=en are present. Headless Chrome at 390×844 shows no horizontal document overflow on the 14 inspected views. This single-size inspection does not certify every device or authenticated flow.	Good

Signal	Finding and recommendation	Priority
Homepage headings	One rendered H1 and logical H2/H3 grouping. H1 accurately describes professional invoice creation. Raw HTML has no headings because of client rendering.	Good
Images/brand	Logo alt is generic logo; hero alt is Invoice Pro Dashboard Preview. Replace with accurate Invoiceo descriptions. The hero loads at 864×576, approximately 256 KB encoded; evaluate a smaller modern image format.	Medium
Internal navigation	Homepage exposes only two anchor links: logo to / and Login here to /login. Signup CTAs are JavaScript buttons, not crawlable anchors. Add real links for navigation and footer links to public information. Keep the guest-tool opener as an action button.	High
Social previews	No Open Graph or Twitter Card metadata in either raw or rendered heads. Add og:title, description, URL, a public absolute image URL, and a suitable card type. Test previews after deployment.	Medium
Favicon	The icon declaration claims image/svg+xml but its URL is /fav_icon.ico. Verify the actual asset type and make the declared type match. This is a minor browser hygiene issue, not a ranking blocker.	Low

Signal	Finding and recommendation	Priority
Public information deployment	/about and /help are real routes in the current workspace but rendered 404s on production. No footer on live home. The deployed bundle index-GFXebytr.js differs from current build; local changes are not credited as live improvements.	High

SEO · Content quality

Signal	Finding and recommendation	Priority
Topic and intent	Homepage clearly offers professional PDF invoices and a no-account guest workflow. This aligns with invoice generator, free invoice generator, and invoice maker without signup intent. Keyword volume and competition were not measured.	Good
Coverage	Homepage has approximately 174 visible whitespace-separated words including UI text. It describes benefits but omits a worked invoice, creation steps, feature limits, pricing scope, privacy, and business/tax limitations. Expand to answer real needs, not to meet an arbitrary word count.	High

Signal	Finding and recommendation	Priority
Unsupported marketing claims	Live copy claims thousands of freelancers, creation in under 30 seconds, and secure PDFs. No supporting evidence or explanation was found on the inspected pages. Verify these claims or replace with precise, demonstrable product descriptions.	High
Freshness	No visible editorial update date, guide publication date, or change history. Do not manufacture dates; add meaningful review dates to future tax/help guidance. The response Last-Modified is not an editorial freshness claim.	Medium
Content architecture	No content-rich pages discovered beyond home through live anchors; /blog, /faq, /contact, /pricing, /about and /help candidates render 404. Unlinked unknown URLs cannot be ruled out without a valid sitemap. Build only useful pages; a blog is not mandatory.	High
Readability	Short paragraphs and clear benefit headings make the rendered home easy to scan. Mobile capture shows oversized hero text and large gaps, consistent with the older deployment. Publish and recheck the existing spacing improvements.	Medium

SEO · Structured data

Signal	Finding and recommendation	Priority
Detection	Zero JSON-LD scripts across 14 rendered URLs; no schema.org microdata/RDFa in captured HTML. There is no markup to validate.	Medium
Entity/application markup	Add truthful Organization and WebSite information and, where appropriate, SoftwareApplication/WebApplication semantics. Confirm operator identity and pricing before adding facts; an anonymous online tool does not need LocalBusiness schema.	Medium
Rich-result constraints	Google software-app rich results require name, offers.price, and a genuine rating or review. Do not invent reviews to satisfy eligibility. Valid entity markup alone does not guarantee rich results. [S6]	Medium
Schema-content agreement	Future structured data must match visible content and use stable absolute URLs and entity IDs. Validate syntax, Schema.org semantics, and Google eligibility separately. No special AI schema is required. [S7]	Medium

GEO · Experience, expertise and trust

Signal	Finding and recommendation	Priority
Operator identity	No named operator, business background, team, or expertise information visible on live home; /about renders 404. Publish the locally created About page, then add verified operator details.	High
Contact/support	No support email, contact address, or contact page discovered; /contact renders 404. Add a real monitored channel. Do not fabricate a physical address for an online service.	High
Privacy and terms	No links on live home to privacy, terms, or storage disclosures; /privacy, /terms and /cookies candidates render 404. Legal content remains pending operator/contact/jurisdiction details in the current implementation. Finalize real practices before publishing.	High
Demonstrated experience	Dashboard illustration shows the product, but no worked invoice walkthrough, named case study, or attributable user evidence was found. Publish an original example using fictional sample data and actual product behavior.	Medium

Signal	Finding and recommendation	Priority
Trust proof	No visible attributable reviews, press mentions, certifications, awards, or supporting evidence for thousands of users. Seek genuine permissioned evidence; awards/certifications are not mandatory.	Medium
Brand consistency	Visible product logo is Invoiceo, hero alt and login copy use Invoice Pro. Choose one public brand and align copy, assets, metadata, and entity markup.	High

GEO - Content for AI synthesis

Signal	Finding and recommendation	Priority
Core proposition	The homepage clearly explains that guest users can create and download a PDF without an account. This is a useful, concrete differentiator to retain.	Good
Explicit entity definition	No clear opening definition links the brand name to its category and audience. Example draft: Invoiceo is an online invoice generator for creating PDF invoices, with a guest mode that does not require an account. Verify scope before publishing.	High

Signal	Finding and recommendation	Priority
Factual density	Few verifiable product facts beyond PDF output, no-signup guest use, draft autosave, and saved client details. Explain supported inputs, account versus guest behavior, currencies, logo support, tax calculation, and export limits after verification.	High
Sources and financial context	No external authoritative references. For future tax/invoice requirement guides, cite relevant official authorities for the intended jurisdiction, with a named reviewer and review date. Do not add citations to simple product claims just for decoration.	Medium
Originality	Original product screenshots and worked examples are more useful than generic billing prose. Add a real step-by-step example, explain limitations, and provide reusable sample invoices where the app supports them.	Medium
Entity links	No verified social profile or sameAs links found. Add only official profiles if they exist; manufacturing profiles/mentions provides no reliable authority signal.	Low

GEO · Technical access

Signal	Finding and recommendation	Priority
HTTPS	The site serves HTTPS and redirects the tested HTTP homepage to HTTPS. This is a sound access foundation; the audit does not certify the entire security posture.	Good
AI retrieval	The web reader could not access the URL; curl and Chrome succeeded. This does not prove a global AI-bot block. Empty initial HTML is independently verified and limits text-only retrieval. Inspect real crawler logs/CDN policies before claiming bots are blocked.	High
Bot policy	No robots file exists. Allow OAI-SearchBot if ChatGPT search visibility is desired and check official published IP ranges against CDN rules. GPTBot training permission is a separate decision. Spoofing a User-Agent is not proof of real bot access. [S8]	Medium
llms.txt	/llms.txt returns 404. This is informational, not a scored defect or a prerequisite for AI inclusion. Prioritize crawlable pages and useful information. [S7]	Not applicable

Signal	Finding and recommendation	Priority
Performance payload	Homepage loads pdf-vendor-Dhr8L51k.js with encodedBodySize 499,249 bytes, plus main JS 164,800 and react/ui JS 64,811 combined. Defer PDF code until the tool is needed. These are one-run byte measurements, not Core Web Vitals scores.	High

AEO · Extractable answers

Signal	Finding and recommendation	Priority
Direct answers	There is no question-phrased H2/H3 on the homepage. No definition paragraph or question/answer section found in discovered live content. Add concise, accurate answers to actual user questions.	High
How-to steps	No numbered creation walkthrough on live home. Provide visible steps: enter business and customer details, add items/dates/tax, check totals, download PDF. Confirm labels against the deployed tool.	High
Question coverage	Answer whether signup is required, what is free, how PDFs are saved/shared, how tax totals work, where drafts are stored, and what an account adds. Pricing/storage promises require owner confirmation and verified behavior.	High

Signal	Finding and recommendation	Priority
Lists and tables	No explanatory list or comparison table present on live home. A small guest-versus-account table can clarify choices after limits are verified. Do not create tables solely to chase snippets.	Medium
Answer paragraph length	A short self-contained answer immediately after its question is useful editorially; 40–60 words is not a Google requirement. Exact snippet selection cannot be promised.	Medium

AEO · Structured formats and voice

Signal	Finding and recommendation	Priority
FAQ schema	No FAQPage markup. Visible FAQ content is the priority. Invoiceo is not in Google's normally eligible government/health categories; do not promise FAQ rich results. [S9]	Low
HowTo schema	No HowTo markup. Google deprecated How-to rich results; adding HowTo is not a high-priority Google visibility fix. A readable walkthrough still helps users. [S9]	Not applicable
Speakable markup	No SpeakableSpecification. It is not a general prerequisite for voice or AI answers; no demonstrated need on this invoice application.	Not applicable

Signal	Finding and recommendation	Priority
Conversational language	Guest section uses plain language and directly states that an account is not required. Retain this strength and extend it into specific questions.	Good
Local SEO	This is an online invoice tool; no local-service business requirement was established. No penalty for missing phone/address, local landing pages, or LocalBusiness markup. Operator/contact transparency remains important.	Not applicable

Priority Recommendations

Priority	Issue	Dimension	Effort	Impact
Critical	Serve real public content in initial HTML; preserve the interactive app separately	SEO/GEO/AEO	Medium–high	Very high
Critical	Fix XML sitemap and meaningful HTTP error responses	SEO/GEO	Medium	Very high
High	Publish the existing footer/About/Help and finalize operator/contact/policies	GEO/SEO	Medium + owner input	High

Priority	Issue	Dimension	Effort	Impact
High	Write route-specific titles/descriptions and set index policy	SEO	Low–medium	High
High	Add a definition, verified FAQ and actual creation walkthrough	AEO/GEO	Medium	High
High	Align brand and verify quantified claims	GEO/SEO	Low	High
High	Defer PDF library loading	SEO/experience	Medium	Potentially high
Medium	Add truthful Organization/Web Site/app data and optional genuine reviews	SEO/GEO	Low–medium	Medium
Medium	Publish crawler policy and verify CDN access	GEO/SEO	Low + log access	Medium
Quick win	Use anchor links for navigation CTAs and descriptive image text	SEO/accessibility	Low	Medium
Quick win	Add canonical and social-sharing metadata	SEO/sharing	Low	Medium
Medium	Establish measurement baseline	All	Low–medium	High for decisions

Acceptance Criteria

Serve real public content in initial HTML; preserve the interactive app separately

Raw HTML includes meaningful H1, product description and links without executing JS. Confirm in Search Console rendered/live inspection.

Fix XML sitemap and meaningful HTTP error responses

sitemap.xml parses as XML and contains only indexable canonical URLs; invented URL returns 404 rather than an app-shell 200.

Publish the existing footer/About/Help and finalize operator/contact/policies

Production footer links resolve to real content; monitored email and accurate privacy/storage disclosures are visible.

Write route-specific titles/descriptions and set index policy

Home describes the invoice generator; public pages have unique metadata; auth/error views are noindex while readable to crawlers.

Add a definition, verified FAQ and actual creation walkthrough

Users can answer core no-signup/pricing/storage/PDF questions from visible content; copy agrees with tested behavior.

Align brand and verify quantified claims

Invoice Pro references removed where inaccurate; user-count/speed/security claims are supported or rewritten.

Defer PDF library loading

Network trace of initial home does not download the PDF vendor before tool interaction; PDF generation still works. Measure CWV before/after.

Add truthful Organization/WebSite/app data and optional genuine reviews

Markup agrees with visible facts; validators pass; no invented ratings or unsupported offers.

Publish crawler policy and verify CDN access

Valid robots.txt points to XML sitemap; real Googlebot/OAI-SearchBot access confirmed through logs/published IP verification.

Use anchor links for navigation CTAs and descriptive image text

Signup CTA is an href link; logo and hero accurately describe Invoiceco.

Add canonical and social-sharing metadata

Real public pages self-canonicalize to HTTPS www; card image and preview fields resolve.

Establish measurement baseline

Search Console ownership, URL Inspection, index report, real-user CWV/PageSpeed and privacy-appropriate conversion data available. No tracking added by this audit.

Suggested Metadata

Editorial drafts; verify claims before publishing. Length ranges are not Google eligibility requirements.

Homepage title

Free Invoice Generator – Create PDF Invoices | Invoiceo

Homepage description

Create a professional PDF invoice with Invoiceo. Enter your business and customer details, add line items, and download your invoice without signing up.

Implementation Sequence

First: fix public HTML delivery, sitemap, status handling and route index policy. Agree the implementation architecture before a substantial rendering/hosting change.

Next: publish local public pages and complete operator/contact/privacy details; add verified definition, FAQ and a worked example.

Then: add consistent entity/social metadata and improve initial payload. Validate public pages and the PDF workflow after each change.

After deployment: check Search Console URL Inspection and Page Indexing; submit the sitemap; collect PageSpeed/field CWV, impressions, clicks and conversions. AI referral visits are a partial measure, not total AI visibility.

What Is Working Well

HTTPS and tested apex/HTTP-to-www 301 redirects are correct.

Rendered homepage has a clear value proposition, one H1 and logical benefit headings.

No-signup PDF creation is a concrete product differentiator.

Viewport meta and lang=en are present; the tested mobile views have no horizontal document overflow.

A genuine product illustration is present, and visible copy is short and scannable.

The local workspace already includes footer/About/Help and spacing work that can be published after verification; it is not counted as live SEO improvement.

Measurement and Re-audit

Establish Search Console index coverage, impressions and clicks; inspect raw/rendered public URLs. Run PageSpeed Insights and field CWV where available. Verify real bot access using server/CDN logs. Sample relevant questions in target answer engines, recording the engine, wording, date and citations. Neither AI citations nor search placement can be guaranteed.

Glossary

SEO: making useful pages discoverable and understandable in search.

GEO: improving the clarity, credibility and accessibility of material generative search systems may retrieve and cite.

AEO: organizing accurate explanations into extractable answers; it overlaps with ordinary SEO.
